STACBOND

Composite panel

STACBOND COMPOSITE PANEL

CHARACTERISTICS

The **STACBOND** composite panel is a product consisting of two aluminium sheets and an inner core with mineral fillers. It has excellent mechanical properties, providing bending stiffness with a reduced weight, a flat surface, durability and ease of maintenance.

They are the ideal solution in all fields of architecture: homes, public buildings, offices, business and industry. That's not to mention their use in promoting a corporate image in, for example, supermarkets, car dealerships, banks and petrol stations. They also offer solutions for the design, transport and industrial sectors.

In its manufacturing standard this product consists of an outer sheet of aluminium alloy 5005 and an inner sheet of alloy 3005/3105.

Two different core materials are available in terms of mineral content (incombustible or fire-retardant), which in accordance with standard UNE-EN 13501-1:2019 are class A2-s1 d0 (**STACBOND A2**) and class B-s1, d0 (**STACBOND FR**).

This is lacquered with the highest quality PVDF 70/30 (polyvinylidene fluoride) which provides excellent resistance to ageing and the highest protection against UV rays, as well as having excellent behaviour when machined or formed.

STACBOND offers a full range of colours, shines, textures and natural finishes. Also, they can be supplied in any RAL/PANTONE/NCS colour – please enquire for details.

The **STACBOND** composite panel is available in various standard dimensions of up to 2.000 mm width. Other dimensions can be supplied under request.

* In three-layer finishes or on request.

All RAL colours possible

A2, FR and PE cores

High resistance to UV rays

Excellent weight/surface value

Easily conformable

Rapid and simple assembly

Totally recyclable

PVDF 70/30 PAINT

Highest quality paint, used in most **STACBOND** regular finishes.

The 70/30 code indicates that the paint contains 70% polyvinylidene fluoride and 30% acrylic resin. This ratio is the optimal level to provide a high level of protection against UV rays and high ageing resistance. Mechanically, the paint has sufficient stretch to resist the forming of the panels without deterioration of the coating.

These finishes have a limited range of shine between 25 – 35%, measured at an angle of 60°.

FEVE (LUMIFLON)

FEVE is a type of coating with a very similar structure to PVDF but it is harder and less flexible. It allows a wider shine range.

HDPE (High durability polyester)

HDPE paint is a slightly lower performance finish than PVDF, but allows high gloss range and some special finishes such as textured surfaces.

INNER FACE PROTECTION PRIMER

The epoxy/epoxy-polyester primer is applied at 5 - 10 microns and protects the interior face of the STACBOND composite panel.

STACBOND COMPOSITE PANEL

OUR COMMITMENT TO THE PLANET

CERTIFIED QUALITY

The manufacture of the **STACBOND** composite panel follows a controlled process by means of rigorous internal tests and quality controls, in our own laboratories and externally through audits by the most prestigious construction institutes in all the countries where we are certified.

The granting of these certificates follows the European guideline of the **EAD GUIDE 090062-01-0404** for ventilated façades and allows us to conclude that our construction systems comply with the national regulations of each country.

INTEGRATED QUALITY AND ENVIRONMENT SYSTEM

STACBOND has an integrated quality and environmental system, based on the **UNE-EN ISO 9001** and **UNE-EN ISO 14001** standards. This is possible because the environmental management system (EMS) implemented in our facilities complies with the requirements of these regulations.

ENVIRONMENTAL PRODUCT DECLARATION

STACBOND A2 and **STACBOND FR** products have renewed the Environmental Product Declaration (EPD) for the **STACBOND** composite façade panel, according to EN ISO 14025:2010 and EN 15804:2012+A2:2019/AC:2021.

The scope of the certificate includes the life phase, raw material sourcing, transport, manufacturing, end-of-life and recycling phase of the product, deconstruction and demolition, transport, waste processing, disposal and reuse-recovery-recycling potential.

ZERO WASTE CERTIFICATE

STACBOND has a system for controlling and monitoring the waste generated in its production process, aimed at guaranteeing reuse, recycling, take-back and recovery, in order to reduce disposal to landfill as much as possible.

STACBOND has therefore been certified as zero waste in accordance with the requirements of the Bureau Veritas certification standard, where it has achieved an advanced level of commitment, certifying an alternative management to landfill of between 80% and 95%.

Our commitment to the planet

STACBOND RECYCLING SERVICE

GIVING ALUMINIUM COMPOSITE PANELS A SECOND LIFE

At **STACBOND**, we promote the circular economy by recycling, separating and reusing aluminium composite panel components. Both the core and the aluminium are fed back into the production process, thus closing the life cycle of the product.

We have implemented the **STACBOND RECYCLING** programme, a waste material collection system to reduce the environmental footprint of our products as much as possible.

With this composite panel collection and recycling system, **we take advantage of the surplus material in the production and installation of panels in buildings and give a new opportunity to the raw materials we use**, avoiding unnecessary waste of resources.

STACBOND A2 is a non-combustible composite panel composed of two sheets of aluminium and a mineral core developed to comply with the most stringent fire-resistance classification rules.

Thanks to the panels' exceptional mechanical properties (high rigidity, excellent flatness, impact resistance, durability and ease of maintenance) and A2-s1, d0 fire-resistance classification (in accordance with UNE-EN 13501-1:2019), they are the ideal cladding solution for tall buildings and high-occupancy buildings.

Compliance with the strictest fire-resistance classification requirements, including:

- ✓ UNE-EN 13501-1:2019 — **A2-s1, d0**
- ✓ LEPİR II — **PASS**
- ✓ PN-B-02867:2013 — **NRO**
- ✓ NFPA 285 — **PASS**
- ✓ ASTM E84 — **A CLASS**
- ✓ MSZ 14800-6 — **PASS**

There may be limitations in the manufacture of STACBOND A2 panels with high gloss finishes. Please consult STAC for compatible finishes.

* Aluminium alloy 5005 available by customer request.

** Check with us for other dimensions.

STACBOND FR

Fire retardant ACP

STACBOND FR panels are composed of two aluminium sheets with a fire retardant core made of thermoplastic resins with mineral load.

The panels have excellent mechanical properties including: high rigidity, excellent flatness and impact resistance. They comply with the majority of requirements for fire-resistance classification:

- ✓ UNE-EN 113501-1:2019 — **B-s1, d0**
- ✓ PN-B-02867:2013 — **NRO**
- ✓ NFPA 285 — **PASS**
- ✓ ASTM E84 — **A CLASS**
- ✓ CAN/ULC-S102 — **SD: 0 FS: 0**
- ✓ ULC-S134 — **PASS**

STACBOND COMPOSITE PANEL

CLEANING AND MAINTENANCE

PRODUCT MAINTENANCE

STACBOND composite panels present an optimal behaviour against possible changes in appearance caused by prolonged exposure to normal climatic conditions.

Facades made of composite panels are exposed to many aggressive agents present in the environment, such as sulphurous compounds, acids and nitrogen compounds caused by acid rain, chemical salts, dirt, soot, etc. These substances mixed with water and combined with UV radiation from the sun can lead to deterioration of the surface finish and shorten life expectancy of the product. These effects are worse in areas where rainwater cannot wash away the impurities.

As long as care is taken to keep the coating in good condition through regular washing and to ensure that incompatible or highly contaminated materials do not come into contact with the surface, the coating will not crack or delaminate, but changes may occur to the uniform appearance, such as slight changes in colour and brightness.

Specifically, for particularly harsh or difficult environments, such as areas with high levels of UV, areas at risk of sandstorms, proximity to chemical factories, swimming pools, saline environments or areas not exposed to natural rain, more rapid deterioration may occur.

For these reasons, the cleaning of roofing and facades is an important part of the care and maintenance of the cladding.

Regular inspection and maintenance is recommended to maintain the optimal appearance and durability of the coated aluminium. Above all, areas not exposed to natural rain, such as overhangs, may need further cleaning to eliminate potentially corrosive deposits. Leaves, grass, mould and other objects should be removed and any obstructions should be cleaned to prevent overflow. Local defects that can cause premature deterioration of the coating or corrosion of the substrate should be examined and repaired.

CLEANING*

Dirt and stained areas can be cleaned with water and as oft brush. A moderate strength power washer can also be used. The surface should then be rinsed down.

For more stubborn stains a pH neutral soap should be used. The detergent must be thoroughly removed after a few minutes with water. To remove a stain, a soft cotton cloth (or similar) wetted with a non-aggressive solvent such as mineral alcohol may be used.

Cleaning the façade should be carried out from top to bottom so that any detergent is washed away completely. The use of strong or detergents or those which are inappropriate for coloured surfaces may damage the finish. If necessary, we recommend carrying out a test clean on a small, low-visibility area of the panel.

We recommend carrying out cleaning of the façade when climatic conditions allow (avoiding high temperatures or strong, direct sunlight).

Moderate pressure washer

Use of neutral detergents

Washing from top to bottom

* Some special finishes require specific cleaning processes. In the vent of doubt, please consult info@stacbond.es

HANDLING

For proper storage and handling of the **STACBOND** aluminium composite panel, the following information should be taken into account:

- Pallets must be handled carefully during transport and unloading, always use suitable equipment such as fork-lift trucks. Never move open pallets.
- Whenever possible, store the material in a dry, dust-free interior space and under temperature conditions between 10° – 40° C.
- If stored outdoors, avoid exposing the material to sunlight by protecting it with an opaque protective cover.
- Always store the pallets in a horizontal position up to a maximum of 6 pallets of the same format stacked on top of each other (4 in case of **STACBOND A2**) or 12.500 Kg total weight.
- The plastic film must be removed from the pallets no later than 6 months after receipt.
- The individual panels should be lifted from the pallet supported by its four corners, avoiding dragging one over the other. Whenever possible, move the individual panels in an vertical position.

Optimal distance between forklift blades for transporting **STACBOND** composite panel pallets.

PROTECTIVE FILM

The protective film used is a temporary surface protector and once the panel is installed in the facade it should be removed as soon as possible as climatic factors (hours of exposure, climate zone, geographic location or sharp changes in temperature) may affect the adhesive used on the protective film and make removal more difficult.

For the machining and later installation of the **STACBOND** composite panel on the facade, it must be ensured that the orientation of the arrows indicated on the protective film must be the same on the entire surface, in order to avoid variations in the tone of the finish.

To ensure the integrity and proper functioning of the **STACBOND** aluminum composite panel protective film, the following information should be considered:

- Prolonged storage of the material with high temperature variations can affect the adhesion of the protective film, making it difficult to remove.
- Do not mark with inks that can pass through the protective film and affect the surface of the panel
- Remove the protective film at the latest one month after the installation of the composite panel in the project. Whenever possible, remove it under temperature conditions higher than 10° C. At the moment of removal, the film must be completely removed from the entire visible part of the façade, as partial removal may cause stains or marks to appear on the front face of the panel.

STACBOND COMPOSITE PANEL

PANEL TRANSFORMATION

CUTTING

STACBOND composite panel can be cut using CNC machinery or manually using a wall saw or portable milling machine. Straight, curved and angled cuts are possible, depending on the tools used.

Consult **STACBOND** for the recommended parameters for the different types of cutting and the machinery used.

MILLING

Performed using CNC, wall saw with milling disk or portable milling machine. The partial milling of the panels allows them to be bent into shape. The scoring is done using 90° or 135° milling bits depending on the bend required. To achieve the desired measurements, the fold must be made on the axis of the milling score line. The remaining thickness of the panel allows it to be bent into shape by hand using specific tools or using a composite panel specific press brake.

Spherical milling groove for 90° bends.

V-shaped milling groove for 135° bends.

*Arc milling groove for complete 180° folds.

*Not suitable for A2 panel.

RECOMMENDED MILLING PARAMETERS:

CORE	PROCESS	ROTATIONAL SPEED (r.p.m.)	DISPLACEMENT SPEED (mm/min)
STACBOND A2	CUTTING	20.000 — 22.000	8.000 — 10.000
	MILLING	22.000 — 24.000	10.000 — 12.000
STACBOND FR	CUTTING	24.000	12.000 — 15.000
	MILLING	24.000	15.000 — 18.000

Note: these values are for guidance only and are intended for use with **STACBOND** recommended milling tools. For use with other tools or depending on the type of machine it is necessary to adjust them.

RECOMMENDED TOOLS **A2** CORE:

- Cutting tool: Ø 6mm milling cutter with diamond insertions (STB-FRESA6PCD).
- Milling tool: Ø 10mm spherical milling cutter with diamond insertions (STB-FRESA10PCD).

RECOMMENDED TOOLS **FR** CORE:

- Cutting tool: Ø 6mm milling cutter with diamond insertions (STB-FD6X80X3,8).
- Milling tool: Ø 10mm spherical milling cutter with diamond insertions (STB-FEMD-10x72).

EMBOSSING AND ENGRAVING

STACBOND composite panels can be embossed and engraved using CNC machines. There are limits on the depth achievable depending on the shape and size of the tool used.

Please consult **STACBOND** about different possible methodologies.

PUNCHING AND DIE-CUTTING*

STACBOND composite panels can be punched or die-cut using CNC machines. The recommended parameters to maintain the panels properties and thus their guarantee are as follows:

- The smallest punch diameter should be 4 mm.
- The distance between centres must be at least double the diameter.
- The perforated surface area must be less than 35% of the total surface area of the panel.

Consult **STACBOND** about possible formats.

* For perforation parameters with **STACBOND A2** panels, please check with the **STACBOND** technical department.

STACBOND COMPOSITE PANEL

PANEL TRANSFORMATION

EDGE FOLDING OF BORDERS

STACBOND composite panels can be edge folded on their profile. We offer three types of border: Simple (hides border), double interior (hides the border and part of the reverse) and double exterior (hides border and has a tab sticking out which hides the joint with other sheets of the panel). The dimensions of the panel must be oversized to account for the requirements of each type of border.

	SIMPLE FOLDING	DOUBLE INTERIOR FOLDING	DOUBLE EXTERIOR FOLDING
UNFOLDED DIAGRAM			
FOLDED DIAGRAM			
FLAP INCREASE (mm)	3,5	7,5	14,0

BENDING WITH ROLLERS

To make curved panels the best system is using a bending machine with 3/4 rollers. To avoid risk of damage, attention must be paid to the minimum radius of the curve of the internal side.

In the case of **STACBOND** composite panels with flaps, the minimum recommended radius is 500 mm for a maximum flap length of 20 mm.

The minimum bending radius without flaps is determined by the following formula:

$$\varnothing \text{ UPPER ROLLER} \times 1,5 / 2 = \text{BENDING RADIUS}$$

For example, in a machine where the diameter of the upper roller is 200 mm, we could bend a 4 mm thick composite panel sheet with a minimum radius of 150 mm.

Bending without flaps of lower radius can be achieved by using press brakes with specific tools. Consult **STACBOND** for more information.

FORMING CASSETTES*

The cassettes in the **STACBOND** systems are formed by bending the perimeter tabs. These tabs are made by partial milling of the panel with the correct dimensions for the system used. For fastening/anchoring the panels, various specific parts are used, such as strips made of aluminium or from the same material as the panel itself, which are attached using rivets. During the forming process we recommend that the panel be duly protected to avoid superficial damage. This process also can be used to form surfaces with three-dimensional relief.

*It is not recommended to fold the tabs of the **STACBOND A2** panel more than twice.

Assembly systems

ASSEMBLY SYSTEMS

STACBOND offers 10 assembly systems to provide new possibilities and solutions for modern architecture. These systems have been meticulously designed to adapt to the specific requirements of each project.

These systems for the installation of **STACBOND** composite panels are split into two main groups depending on the substructure:

T SUBSTRUCTURE

- **STB-T-CH** (suspended system)
- **STB-T-CH-PRO®** (suspended system)
- **STB-T-SZ** (male-female system)
- **STB-T-SZ-PRO®** (male-female system)
- **STB-T-REM** (riveted system)
- **STB-T-PEG** (glued system)

OMEGA SUBSTRUCTURE

- **STB-CH** (suspended system)
- **STB-SZ** (male-female system)
- **STB-REM** (riveted system)

The **STB-T-CH**, **STB-T-CH-PRO®**, **STB-T-SZ**, **STB-T-SZ-PRO®**, **STB-T-REM** and **STB-T-PEG** systems employ special L spacers and T profile.

The **STB-CH**, **STB-SZ** and **STB-REM** systems employ the same substructure elements, DOUBLE T spacers and OMEGA profile.

The STACBOND **STB-T-CH**, **STB-T-SZ**, **STB-T-REM**, **STB-CH**, **STB-SZ** and **STB-REM** installation systems for **STACBOND** composite panels have the European technical evaluation document ETE/ETA 15-0655 and CE marking according to EAD guide 090062-01-0404.

STB-T-CH

SUSPENDED SYSTEM

STB-T-CH SYSTEM

DESCRIPTION

SEE ASSEMBLY
VIDEO

The **STB-T-CH** is a kit system based on hanging cassettes made of **STACBOND composite panels for the assembly of ventilated façades**. It is a versatile, fast-assembly, concealed fixing system, specially designed to develop façades with horizontal or vertical modulation.

The substructure intended to support the formed CH panels is composed of **L-spacers** (alloy 5005 H24 or INOX AISI 304/430) and **T-OMEGA profiles** (alloy 6063 T5/T6).

These spacers have different lengths to accommodate the required thickness of thermal insulation and to absorb all the irregularities of the façade. For the

thermal bridge break, **STAC** has developed specific **GROOVE WASHERS** to be placed between the spacers L and the wall facing.

The connection of the formed cassettes to the substructure is achieved by means of recesses in the vertical flanges of the cassettes and their hidden stiffeners attached on the rear face, so that they rest on the hanger supports and are screwed or riveted to the profiles T-OMEGA.

The **STB-T-CH** system complies with the main international certifications.

INSULATING WEDGE AND GROOVE WASHER (1)

REF. 05.19.068 / 05.19.072 / 05.19.066

REF. 05.19.070

Optional insulating wedges and insulation covers, for eliminating thermal bridges in spacers.

SPACER L (*) (2)

REF. 05.19.041/ 05.19.044 / 05.19.051 / 05.19.052 / 05.19.053 / 05.19.054 / 05.19.055 / 05.19.056

Designed to connect the studs to the supporting wall. Available in different sizes depending on the desired system thickness.

(*) Also available in stainless steel

SPACER DOUBLE L

REF. 05.19.042 / 05.19.045

Designed to jointly connect two studs to the supporting wall.

PROFILE T-OMEGA (3)

REF. 05.19.061

In vertical joints between cassettes and in an intermediate position, for fixing **T-CH HANGER SUPPORT**, CH cassette and **MINI** or **LONG** horizontal stiffener support.

PROFILE L INTERMEDIATE (4)

REF. 05.19.059

Designed to be located in the middle of two T-OMEGAS in order to lighten substructure, supporting the horizontal stiffener and its corresponding bracket.

BRACKET SET STB-T-CH HANGING (5)

REF. 05.19.062

For hanging the **CH cassettes** to the substructure. Clipped to the **PROFILE T-OMEGA** for easy adjustment and fixed with 2 self-drilling screws to the profile.

STB-T-CH SYSTEM

SYSTEM COMPONENTS

CH CASSETTE LOWER CLIP

REF. 05.19.108

It is placed next to the intermediate profiles to fix the cassette on its lower part and to facilitate its alignment.

CH HORIZONTAL STIFFENING BRACKET (6)

REF. 05.19.106 / 05.19.105 / 05.19.109

Available in **LONG**, **SHORT** and **MINI** sizes, depending on the profile type on which it should be installed.

STIFFENER SCH

REF. 05.19.025 / 05.19.026 / 05.19.027 / 05.19.027.1 / 05.19.027.2 / 05.19.027.3

Attaches to the back of the cassette with elastic adhesive. Enables the execution of larger cassettes.

STIFFENING PROFILE (7)

REF. 05.19.107

It is fixed to the back of the cassette, fits on specific supports, and allows the execution of larger cassettes (width and height).

CASSETTE FORMING PLATE

REF. 05.19.050

It is used for forming, together with rivets, the corners of cassettes with 45 mm vertical flange.

REINFORCEMENT PLATE FOR HANGER

REF. 19.019

It is used for forming, together with rivets, in all cassettes with a vertical flange of 40 mm.

ANCHOR AND SCREW

REF. STB-T0800 / STB-T0801

For fixing the spacer to concrete or masonry. The specific load shall **be checked by extraction test according to ETAG 020**.

SEPARATOR / UPRIGHT FIXING SCREW

REF. STB-T0300 / STB-T0310 / STB-T0311 / STB-T0312

For fixing the upright to the spacer.

SCREW FIXING TO UPRIGHT

REF. STB-T0600 / STB-T0610

For attaching **CH cassette**, STB-T-CH HANGER SUPPORT, or CH HORIZONTAL STIFFENING SUPPORT, to the T-OMEGA or L profile.

FLAT HEAD SCREW (*)

REF. STB-T0700

For attaching stiffeners to the cassette at the ends.

(*) Possibility of delivery lacquered

FORMED RIVET (*)

REF. STB-R0300

For cassette forming.

(*) Possibility of delivery lacquered

STB-T-CH SYSTEM

STANDARD CH WING CASSETTE 45mm

STB-T-CH standard tray panel hooks are cut out during machining process so they can be hung on previously installed hanging devices.

The cassette is formed by means of rivets and specific forming plates.

Once the cassette is in place, it is fixed to the upright by means of a self-drilling screw through the upper flange.

STB-T-CH SYSTEM

VERTICAL CASSETTE STIFFENER

VERTICAL STIFFENER

The vertical stiffener is a corner-shaped piece formed from machined **STACBOND** composite panel. It is used to reinforce CH cassettes, when they exceed certain dimensions. The stiffener is attached by double-sided tape and adhesive to the inside face of the cassette and riveted to the horizontal upper and lower flanges.

1. PREPARATION OF THE AREA

Dust and dirt shall be removed using mechanical processes, which shall consist of more or less deep sanding, depending on the existing dirt. Once cleaned, the area shall be primed with a specific product that reinforces the adhesion of the elastic adhesive SIKATAACK PANEL PRIMER (or similar).

2. DOUBLE-SIDED ADHESIVE TAPE

After priming, the self-adhesive tape CINTA SIKATAACK PANEL-3 (or similar) shall be applied. Subsequently, the elastic adhesive SIKATAACK PANEL 50 (or similar) shall be spread over cassette surface by applying a continuous bead adjacent to the double-sided tape.

3. FITTING AND FIXING OF THE STIFFENER

The stiffener shall then be placed in such a way that the entire surface of the stiffener is impregnated with adhesive. Finally the stiffener shall be drilled and riveted at the top and bottom against the horizontal flanges of the cassette.

EVOLUTION OF SYSTEMS FROM **STB-T-CH** to **STB-T-CH evo®**

NEW COMPONENTS OF THE SYSTEM

NEW HORIZONTAL STIFFENER

The horizontal stiffener is an optional extruded aluminium profile, which allows the construction **of large CH cassettes in both horizontal and vertical modulations.**

The horizontal stiffener must be clipped into a set of custom single supports pre-fixed to all mullion profiles.

The use of these stiffeners not only eliminates the use of more expensive vertical stiffeners, but also allows the maximum spacing between studs to be increased.

With this new horizontal stiffener, the intermediate profiles can be executed with a lighter L-profile, fitted with the aforementioned stiffener supports instead of the classical T-OMEGA profiles with standard CH hangers, further increasing the savings in substructure.

The number of stiffeners to be placed will be indicated in the wind calculation note issued by the **STACBOND** technical office.

HORIZONTAL STIFFENER PLACEMENT

Clean the gluing area of the stiffener and cassette with a specific cleaner.

Glue with specific 1.6 mm thick structural tape.

System compatible with Omega substructure.

EVOLUTION OF SYSTEMS FROM **STB-T-CH** to **STB-T-CH evo®**

NEW ELEMENTS OF THE SYSTEM

The **STB-T-CH evo® system cassettes** are easier to machine than the STB-T-CH cassettes, as they have fewer hooks.

Therefore, machining, forming and installation is faster and more economical.

UNFOLDED CASSETTE

EVOLUTION OF SYSTEMS FROM **STB-T-CH** to **STB-T-CH evo®**

NEW ELEMENTS OF THE SYSTEM

NEW BOTTOM CLIP CH CASSETTE

The new bottom clip is placed on the **bottom flange** of the **CH cassette**, right next to the intermediate profiles, in order to fix the CH cassette at the bottom and facilitate its alignment.

EVOLUTION OF SYSTEMS FROM **STB-T-CH** to **STB-T-CH evo®**

NEW FORMS OF MODULATION

HORIZONTAL AND VERTICAL MODULATIONS

Thanks to the placement of the stiffener, the **evo®** system allows horizontal and vertical modulations.

In addition to the versatility in modulation, it **allows a maximum spacing between vertical uprights of 1200 mm***, much wider than traditional CH.

* Measurement to be consulted according to specific STACBOND calculation note.

SAVINGS IN MATERIALS

- Greater separation between uprights, allowing a saving in the amount of substructure to be used.
- The intermediate profile T-OMEGA is replaced by L-profiles, which are more economical.*
- The horizontal stiffener gluing system is more economical.

* Only at low wind loads

FACADES WITHOUT LIMITS

Possibility of an aesthetically cleaner vertical joint thanks to the mini hanger.

STB-T-CH-PRO®

SUSPENDED SYSTEM

STB-T-CH-PRO® SYSTEM

DESCRIPTION

SEE ASSEMBLY
VIDEO

The **STB-T-CH-PRO®** is a kit system based on suspended cassettes made of **STACBOND composite panel for the assembly of ventilated façades**. It is a versatile, fast-assembly, concealed fixing system, specially designed to develop façades with horizontal or vertical modulation.

The substructure is composed of **L-spacers** (alloy 5005 H24 or INOX AISI 304/430) and new **STB-T-CH-PRO®** profiles (alloy 6063 T5/T6).

These spacers have different lengths to accommodate the required thickness of thermal insulation and to absorb all the irregularities of the façade. For the

thermal bridge break, **STAC** has developed specific **INSULATING WEDGES** to be placed between the spacers L and the wall facing.

The connection of the formed cassettes to the substructure is made by means of recesses in the vertical flanges of the cassettes and in their concealed stiffeners attached on the rear face, so that they rest on the hanger supports and are screwed or riveted to the **STB-T-CH-PRO®** profiles.

The **STB-T-CH-PRO®** system complies with the main international certifications.

STB-T-CH-PRO® SYSTEM

SYSTEM COMPONENTS

INSULATING WEDGE AND GROOVE WASHER (1)

REF. 05.19.068 / 05.19.072 / 05.19.066

REF. 05.19.070

Optional insulating wedges and insulation covers, for eliminating thermal bridges in spacers.

EVOLUTION OF THE **STB-T-CH** SYSTEM to **STB-T-CH-PRO**®

NEW COMPONENTS OF THE SYSTEM

NEW STB-T-CH PRO® HANGING BRACKET SET

When clipping the **STB-T-CH-PRO**® hanger support onto the profile, its height can be easily adjusted and thanks to the pre-installed screw already included in the part, it will be fixed easily, quickly and without damaging it.

Since the fastening screw is always accessible through the joint between the parts, the **STB-T-CH-PRO**® system allows positional corrections of the hangers even with the cassette installed, and facilitates their replacement without the need to dismantle the upper cassettes.

In addition, the **STB-T-CH-PRO**® system also simplifies the installation of end pieces and false ceilings.

New STB-T-CH-PRO® profile with integrated central screw guide.

New hanger support **STB-T-CH-PRO**® with built-in central fixing screw.

Top view and detail of the positioning of the hanger support on the profile **STB-T-CH-PRO**®.

EVOLUTION OF THE **STB-T-CH** SYSTEM to **STB-T-CH-PRO**®

NEW COMPONENTS OF THE SYSTEM

NEW HORIZONTAL STIFFENER

The horizontal stiffener is an optional extruded aluminium profile, which allows the construction **of large CH cassettes in both horizontal and vertical modulations**.

The horizontal stiffener must be clipped into a set of custom single supports pre-fixed to all mullion profiles.

The use of these stiffeners not only eliminates the use of more expensive vertical stiffeners, but also allows the maximum spacing between studs to be increased.

With this new horizontal stiffener, the intermediate profiles can be executed with a lighter L-profile, fitted with the aforementioned stiffener supports instead of the classical T-OMEGA profiles with standard CH hangers, further increasing the savings in substructure.

The number of stiffeners to be placed will be indicated in the wind calculation note issued by the **STACBOND** technical office.

HORIZONTAL STIFFENER PLACEMENT

Clean the gluing area of the stiffener and cassette with a specific cleaner.

3M VHB Structural Tape 3M VHB GPH-160GF series* 1.6 mm thick and 25 mm wide.

*Bonding can also be carried out with elastic adhesive specific for this application.

EVOLUTION OF THE **STB-T-CH** SYSTEM to **STB-T-CH-PRO®**

NEW COMPONENTS OF THE SYSTEM

NEW BOTTOM CLIP CH CASSETTE

The new bottom clip is placed on the **bottom flange** of the **CH cassette**, right next to the intermediate profiles, in order to fix the CH cassette at the bottom and facilitate its alignment.

EVOLUTION OF THE STB-T-CH SYSTEM to STB-T-CH-PRO®

NEW FORMS OF MODULATION

HORIZONTAL AND VERTICAL MODULATIONS

Thanks to the placement of the stiffener, the **PRO®** system allows horizontal and vertical modulations.

In addition to the versatility in modulation, it **allows a maximum spacing between vertical uprights of 1200 mm***, much wider than traditional CH.

* Measurement to be consulted according to specific STACBOND calculation note.

SAVINGS IN MATERIALS

- Greater separation between uprights, allowing a saving in the amount of substructure to be used.
- Intermediate profiles T-OMEGA are replaced by more economical L-profiles*.
- The horizontal stiffener gluing system is more economical.

* Only at low wind loads

DETACHABLE AND REUSABLE

The adjustable hanger facilitates the positioning of the cassette and allows corrections with the cassette installed and the substitution of cassettes without the need to remove the upper cassettes.

FACADES WITHOUT LIMITS

The placement of parts in false ceilings will be simpler and the vertical joint will be aesthetically cleaner thanks to the mini hanger.

STB-T-SZ

MALE-FEMALE SYSTEM

STB-T-SZ SYSTEM

DESCRIPTION

SEE ASSEMBLY
VIDEO

The **STB-T-SZ** is a kit system based on **STACBOND composite panel cassettes for the assembly of ventilated façades**. It is a tongue and groove system with concealed fixing, versatile and quick to assemble, specially designed to develop façades with horizontal or vertical modulation, with predominantly blind parts and/or little surface area of openings or linear openings.

This system also allows us to execute curved cassettes. It consists of two 6063 T5/T6 aluminium alloy profiles 6063 T5/T6 on which the already formed cassettes are anchored:

- Lower female profile, so-called **S-profile**.
- Upper male profile, so-called **Z-profile**.

The substructure is composed of **L-spacers** (alloy 5005 H24 or INOX AISI 304/430) and **T, L or profiles T-OMEGA** (alloy 6063 T5/T6).

These spacers have different lengths to accommodate the required thickness of thermal insulation and to absorb all the irregularities of the façade. For the thermal bridge break, **STAC** has developed specific **INSULATING WEDGES** to be placed between the spacers L and the wall facing.

INSULATING WEDGE AND GROOVE WASHER (1)

REF. 05.19.068 / 05.19.072 / 05.19.066

REF. 05.19.070

Optional insulating wedges and insulation covers, for eliminating thermal bridges in spacers.

SPACER DOUBLE L

REF. 05.19.042 / 05.19.045

Designed to jointly connect two studs to the supporting wall.

PROFILE L INTERMEDIATE (4)

REF. 05.19.059

In the intermediate position of the cassettes, for the attachment of SZ cassette, and **SHORT** horizontal stiffener bracket.

SPACER L (*) (2)

REF. 05.19.041/ 05.19.044 / 05.19.051 / 05.19.052 / 05.19.053 / 05.19.054 / 05.19.055 / 05.19.056

Designed to connect the studs to the supporting wall. Available in different sizes depending on the desired system thickness.

(*) Also available in stainless steel

PROFILE T (3)

REF. 05.19.043

In vertical joints between cassettes and intermediate position, for fixing of SZ cassette, and **LONG** support of horizontal stiffener.

PROFILE T-OMEGA

REF. 05.19.061

In vertical joints between cassettes and intermediate position, for fixing of SZ cassette, and **MINI** horizontal stiffener bracket.

STB-T-SZ SYSTEM

SYSTEM COMPONENTS

S PROFILE (5)

REF. 05.19.121

It is installed in the lower part of the SZ cassette.

Z PROFILE (6)

REF. 05.19.122

It is installed on top of the SZ cassette.

STARTER PROFILE (7)

REF. 05.19.099

To support the first cassette at the foot of the façade.

SZ HORIZONTAL STIFFENER BRACKET (8)

REF. 05.19.101 / 05.19.100 / 05.19.110

Available in **LONG**, **SHORT** and **MINI** sizes, depending on the profile type on which it should be installed.

PIECE OF GASKET JOINT

REF. 05.19.129

To be fitted to starter profiler and Z-profile.

STIFFENING PROFILE (9)

REF. 05.19.107

It is fixed to the back of the cassette, fits on specific supports, and allows for larger cassettes (width and height), which are fully removable and reusable.

REINFORCEMENT STB-T-SZ

REF. 05.19.049

It is fixed to the vertical upright and glued to the rear face of the cassette so that higher cassettes can be made.

SEPARATOR / UPRIGHT FIXING SCREW

REF. STB-T0300 / STB-T0310 / STB-T0311 / STB-T0312

For fixing the upright to the spacer.

FLAT HEAD SCREW (*)

REF. STB-T0700

For fixing stiffeners to the ends of the cassette.

(*) Possibility of delivery lacquered

ANCHOR AND SCREW

REF. STB-T0800 / STB-T0801

For fixing spacer to concrete or masonry. The specific load shall be checked by extraction test according to ETAG 020.

SCREW FIXING TO UPRIGHT

REF. STB-T0600 / STB-T0610

For attaching the SZ cassette, SZ HORIZONTAL STIFFENING SUPPORT, and STARTER PROFILE to the T, L or PROFILE T-OMEGA.

FORMED RIVET (*)

REF. STB-R0300

For cassette forming.

(*) Possibility of delivery lacquered

STB-T-SZ SYSTEM

STANDARD SZ CASSETTE

The standard cassettes of the **STB-T-SZ** system have 30 mm flanges. They are mechanically fastened by means of rivets directly onto the longitudinal profiles S and Z for forming.

The **S-profile** is placed at the bottom and the **Z-profile** at the top of the cassette. The profiles provide high longitudinal rigidity to the cassettes.

UNFOLDED CASSETTE

FORMED CASSETTE

DETAIL A

DETAIL B

DETAIL C

SEE CASSETTE
FORMING
VIDEO

STARTER PROFILE AND CLOG REMOVER

The co-extruded gap seal is easily installed in the **Z-profile** and the **starter profile**, with a maximum gap of 500 mm between them.

This avoids possible vibrations between cassettes, and facilitates the adjustment of cassettes to ensure the correct levelling of the pieces.

USE OF STB-T-SZ REINFORCEMENT

The use of STB-T-SZ reinforcement varies depending on the height of the cassette and the wind load of the project site.

It is required to be used on each of the mullion profiles to which the composite panel cassette is attached.

The STB-T-SZ reinforcement is fixed to the **T or profile L intermediate**, using rivets, and double-sided tape and specific adhesive is applied to the front face of the reinforcement.

Subsequently, the cassette is placed, which **is adhered to the reinforcement** on the back side.

The number of STB-T-SZ reinforcements to be installed will be indicated in the wind calculation note issued by the **STACBOND** technical office.

EVOLUTION OF THE **STB-T-SZ** SYSTEM to **STB-T-SZ evo®**

NEW COMPONENTS OF THE SYSTEM

NEW HORIZONTAL STIFFENER

The horizontal stiffener is an optional extruded aluminium profile, which allows the construction **of large-sized SZ cassettes in both horizontal and vertical modulations, and allowing the free disassembly of the cassette and its subsequent reuse** (unlike the cassettes in which the STB-T-SZ reinforcement is used).

The horizontal stiffener must be clipped into the horizontal SZ stiffening brackets, which are pre-fixed to all mullion profiles.

The use of these stiffeners not only **improves the versatility of the STB-T-SZ system**, but also allows the **maximum spacing between uprights** to be **increased** compared to a system without stiffeners or with STB-T-SZ reinforcements.

The number of stiffeners to be placed will be indicated in the wind calculation note issued by the **STACBOND** technical office.

HORIZONTAL STIFFENER PLACEMENT

Clean the gluing area of the stiffener and cassette with a specific cleaner.

3M VHB Structural Tape 3M VHB GPH-160GF series* 1.6 mm thick and 25 mm wide.

*Bonding can also be carried out with elastic adhesive specific for this application.

System compatible with Omega substructure.

EVOLUTION OF THE **STB-T-SZ** SYSTEM to **STB-T-SZ evo®**

NEW FORMS OF MODULATION

HORIZONTAL AND VERTICAL MODULATIONS

Thanks to the placement of the stiffener, the **evo®** system allows horizontal and vertical modulations, with fully **removable** and **reusable** cassettes.

In addition to the versatility in modulation, it **allows a maximum spacing between vertical stanchions of 1200 mm***, much wider than traditional SZ.

*Measurement to be consulted according to specific STACBOND calculation note.

SAVINGS IN MATERIALS

New, lighter and more efficient S-profile, Z-profile and starter profile.

DETACHABLE AND REUSABLE

The cassettes can be easily replaced thanks to the horizontal stiffener.

FACADES WITHOUT LIMITS

Designed for the execution of façades with horizontal or vertical modulation.

STB-T-SZ-PRO®

MALE-FEMALE SYSTEM

STB-T-SZ-PRO® SYSTEM

DESCRIPTION

SEE ASSEMBLY
VIDEO

System compatible with
Omega substructure.

The **STB-T-SZ-PRO®** is a kit system based on **STACBOND composite panel cassettes for the assembly of ventilated façades**. It is a tongue and groove system with concealed fixing, versatile and quick to assemble, specially designed to develop façades with horizontal or vertical modulation, with predominantly blind parts and/or little surface area of openings or linear openings.

It consists of two 6063 T5/T6 aluminium alloy profiles 6063 T5/T6 on which the already formed cassettes are anchored:

- Lower female bracket, so-called **S-bracket**.
- Upper male bracket, so-called **Z-bracket**.

The substructure is composed of **L-spacers** (alloy 5005 H24 or INOX AISI 304/430) and **T, L or profiles T-OMEGA** (alloy 6063 T5/T6).

These spacers have different lengths to accommodate the required thickness of thermal insulation and to absorb all the irregularities of the façade. For the thermal bridge break, **STAC** has developed specific **INSULATING WEDGES** to be placed between the spacers L and the wall facing.

INSULATING WEDGE AND GROOVE WASHER (1)

REF. 05.19.068 / 05.19.072 / 05.19.066

REF. 05.19.070

Optional insulating wedges and insulation covers, for eliminating thermal bridges in spacers.

SPACER DOUBLE L

REF. 05.19.042 / 05.19.045

Designed to jointly connect two studs to the supporting wall.

PROFILE L INTERMEDIATE (4)

REF. 05.19.059

In the intermediate position of the cassettes, for the attachment of SZ cassette, and **SHORT** horizontal stiffener support.

SPACER L (*) (2)

REF. 05.19.041/ 05.19.044 / 05.19.051 / 05.19.052 / 05.19.053 / 05.19.054 / 05.19.055 / 05.19.056

Designed to connect the studs to the supporting wall. Available in different sizes depending on the desired system thickness.

(*) Also available in stainless steel

PROFILE T-OMEGA (3)

REF. 05.19.061

In vertical joints between cassettes, for fixing of SZ cassette, and **MINI or LONG** support of horizontal stiffener.

REF. STB-T0700

For attaching end stiffeners to the cassette.

(*) Possibility of delivery lacquered

STB-T-SZ-PRO® SYSTEM

STANDARD NARROW BRIM SZ CASSETTE

STB-T-SZ-PRO® standard tray panels are easier to machine than CH system ones. Forming becomes also a simpler task since it is carried out using screws directly fixed to S and Z mounting brackets.

The **S-shaped bracket** is placed at the bottom whilst the **Z-shaped bracket** at the top of each tray panel.

These custom mounting brackets save significant amounts of profile compared to conventional SZ systems.

UNFOLDED CASSETTE

FORMED CASSETTE

DETAIL A

DETAIL B

DETAIL C

STB-T-SZ-PRO® SYSTEM

STANDARD WIDE BRIM SZ CASSETTE

STB-T-SZ-PRO® tray panels can also be produced with larger flaps 48 mm wide. They're still easier to machine than CH system tray panels. Forming becomes a simpler task too since it is carried out using screws directly fixed to S and Z mounting brackets.

The **S-shaped** bracket is placed at the bottom whilst the **Z-shaped** bracket at the top of each tray panel.

These custom mounting brackets save significant amounts of profile compared to conventional SZ systems.

UNFOLDED CASSETTE

FORMED CASSETTE

The cassette **STB-T-SZ-PRO®** long-flange trough improves water channelling in vertical joints.

STB-T-SZ-PRO® SYSTEM

NEW COMPONENTS OF THE SYSTEM

NEW HORIZONTAL STIFFENER

The horizontal stiffener is an optional extruded aluminium profile, which allows the construction **of large-sized SZ cassettes in both horizontal and vertical modulations, and allowing the free disassembly of the cassette and its subsequent reuse** (unlike the cassettes in which the STB-T-SZ reinforcement is used).

The T-profile must be clipped into the horizontal SZ stiffening brackets, which are pre-fixed to all mullion profiles.

The use of these stiffeners not only **improves the versatility of STB-T-SZ-PRO®**, but it also allows to **increase the maximum spacing between uprights** compared to a system without stiffeners or with STB-T-SZ reinforcements.

The number of stiffeners to be placed will be indicated in the wind calculation note issued by the **STACBOND** technical office.

HORIZONTAL STIFFENER PLACEMENT

Clean the gluing area of the stiffener and cassette with a specific cleaner.

3M VHB Structural Tape 3M VHB GPH-160GF series* 1.6 mm thick and 25 mm wide.

*Bonding can also be carried out with elastic adhesive specific for this application.

System compatible with Omega substructure.

Fasten at the ends with screws.

EVOLUTION OF THE STB-T-SZ SYSTEM to STB-T-SZ-PRO®

ADDITIONAL COMPONENTS

NEW "Z" AND "S" BRACKETS

With these new accessories, we have converted a continuous concealed fastening system into a **point fastening system**, consisting solely of **screws** (without any rivets).

The horizontal joints (now 8 mm) have a **double upper flange** that gives them visual homogeneity. In addition, the vertical joints are completely uncluttered and visually free of any fasteners.

As a result, the **STB-T-SZ-PRO® system** is:

- The most aesthetic of the concealed fixing systems.
- Lower cost of materials.
- Quicker to form.
- Easier and faster to install.
- More competitive, more PRO®.

Position of the Z- and S-brackets on the shaped cassette.

EVOLUTION OF THE **STB-T-SZ SYSTEM** to **STB-T-SZ-PRO®**

NEW COMPONENTS OF THE SYSTEM

NEW STARTER PROFILE AND CLOG REMOVERS

The co-extruded **gap** seal is simply fitted to the starter profile at the **Z-brackets**.

This gasket is supplied pre-installed on the Z-brackets of the **STB-T-SZ-PRO®** system.

This avoids possible vibrations between cassettes, and allows the adjustment of cassettes to ensure the correct levelling of the pieces.

We also have a **new starter profile**, to be able to place the first cassette at the foot of the façade, with this being completely hidden.

EVOLUTION OF THE **STB-T-SZ SYSTEM** to **STB-T-SZ-PRO®**

NEW COMPONENTS OF THE SYSTEM

CUTTERBLOCK JOINTS

The long brackets make it possible to easily make cutterblock joints.

POSSIBILITY OF CONTINUOUS TRIM

The horizontal stiffener makes it possible to execute continuous trim and reframing, which could not be achieved with the STB-SZ system (individual reframing).

The horizontal stiffener allows the execution of continuous trims and reframing, which could not be achieved with the STB-T-SZ system.

Enclosures with the former STB-T-SZ system.

Continuous enclosures with the **PRO®** system.

EVOLUTION OF THE STB-T-SZ SYSTEM to **STB-T-SZ-PRO®**

NEW FORMS OF MODULATION

HORIZONTAL AND VERTICAL MODULATIONS

The **PRO®** system allows for lighter façades, with fewer materials and less assembly time.

In addition to the versatility in modulation, it **allows a maximum spacing between vertical uprights of 1200 mm***, much wider than traditional SZ.

* Measurement to be consulted according to specific STACBOND calculation note.

SAVINGS IN MATERIALS

Achieve greater spacing between uprights and save on the amount of substructure to be used.

DETACHABLE AND REUSABLE

The cassettes can be easily replaced thanks to the horizontal stiffener.

FACADES WITHOUT LIMITS

Designed for the execution of façades with horizontal and vertical modulation.

MORE AESTHETIC

It allows the execution of continuous recesses and horizontal joints with the same finish as the panel.

STB-T-REM

RIVETED SYSTEM

STB-T-REM SYSTEM

DESCRIPTION

SEE ASSEMBLY
VIDEO

The **STB-T-REM** is a kit system of unformed panels from **STACBOND composite panels for the assembly of ventilated façades**. It is an exposed fastening system that is quick to assemble and can be used for both horizontal and vertical cut-outs. It is a very versatile system that is adaptable and offers the possibility to execute curved areas in a simple way. Therefore, the **STB-T-REM** system meets all the requirements for the most demanding architectural coatings.

The substructure is composed of **L-spacers** (alloy 5005 H24 or INOX AISI 304/430), and **T or L** shaped profiles (alloy 6063 T5/T6).

The spacers are provided in various lengths to accommodate the necessary thickness of thermal insulation and absorb all the irregularities of the façade. In order to avoid thermal bridges STAC has developed specific **INSULATING SOCKS** to be placed between L-spacers and wall facing.

STACBOND tray panels are fixed to the substructure (T/L) using large flange head alu/stainless steel rivets (ref. STB-R0100).

The **STB-T-REM** system complies with the main international certifications.

INSULATING WEDGE AND GROOVE WASHER (1)

REF. 05.19.068 / 05.19.072

REF. 05.19.070

Optional insulating wedges and insulation covers, for eliminating thermal bridges in spacers.

SPACER L (2)

REF. 05.19.041 / 05.19.044 / 05.19.051 / 05.19.052 / 05.19.053 / 05.19.054 / 05.19.055 / 05.19.056

Designed to connect the studs to the supporting wall. Available in different sizes depending on the desired system thickness.

SPACER DOUBLE L

REF. 05.19.042 / 05.19.045

Designed to jointly connect two studs to the supporting wall.

PROFILE T (3)

REF. 05.19.043

In vertical joints between cassettes, for fixing **STACBOND composite panels**.

PROFILE L INTERMEDIATE (4)

REF. 05.19.059

In the intermediate position of the cassettes, for fixing **STACBOND composite panel**.

ANCHOR AND SCREW

REF. STB-T0800 / STB-T0801

For fixing the spacer to concrete or masonry. The specific load shall be checked by extraction test according to ETAG 020.

STB-T-REM SYSTEM

SYSTEM COMPONENTS

SEPARATOR / UPRIGHT FIXING SCREW

REF. STB-T0300 / STB-T0310 / STB-T0311 / STB-T0312

For fixing the upright to the spacer.

BLIND RIVET

REF. STB-R0100

For fixing panels on structures STB-T-REM.

(*) Possibility of delivery lacquered

STAINLESS STEEL BLIND RIVET

REF. STB-R0200

For fixing panels on STB-T-REM structures for high chloride exposure environments.

SAFETY SCREW

REF. STB-T0100

For fixing panels on structures STB-T-REM.

(*) Possibility of delivery lacquered

NOZZLE FOR RIVETING MACHINE

REF. STB-FIJA-201 / STB-FIJA-202

Allows to limit the clamping force of the rivet head against the panel.

DOUBLE DRILL BIT

REF. STB-FIJA-203

Allows simultaneous drilling of the panel to 7 mm diameter and the substructure to 5.1 mm diameter.

DEPTH STOP

REF. STB-FIJA-204

Together with the double bit it allows to limit the thickness of the 7 mm hole in the panel.

CENTERING DEVICE

REF. STB-FIJA-205 / STB-FIJA-206 / STB-FIJA-207

To drill a 5.1 mm hole in the substructure centred on the sliding points of the panel.

DRIVER BIT

REF. STB-FIJA-208

For fixing the safety screw.

MANUAL CENTRING DEVICE

REF. STB-FIJA-209

For centring the safety screw in the sliding points of the panel.

STB-T-REM SYSTEM

ADDITIONAL COMPONENTS

PROFILE L INTERMEDIATE

The profile L INTERMEDIATE is used in addition to the T-profile, thus reducing the weight of the substructure.

It is used as an upright for fixing intermediate points of **STACBOND** composite panels.

PANEL EXPANSION

The composite panel, being largely composed of aluminium, is **subject to expansion and contraction due to temperature changes**.

To place the panel in the exact desired position, the panel should initially be riveted at **1 or 2 fixed points**, with holes in the panel of **5.1 mm diameter**, the location of which should **minimise the expansion of the panel in all directions**.

To avoid possible problems due to this phenomenon, and to absorb possible expansion, the rest of the holes in the panel should be **sliding points**: i.e. if the rivet body diameter is 5 mm, the **hole in the panel should be 7 to 8.5 mm in diameter**.

It is also important that the 5.1 mm drill hole in the substructure and thus the positioning of the rivets is **perfectly centred on the sliding points**, in order to allow for equal expansion in all directions. We use **centring devices** for this purpose.

In addition, in order not to block the expansion of the panel, it is important to **limit the clamping force of the rivet head against the panel**. This is achieved by using riveting machine **nozzles** to **maintain a 0.2 mm gap** between the rivet head and the panel.

CORRECT INSTALLATION *

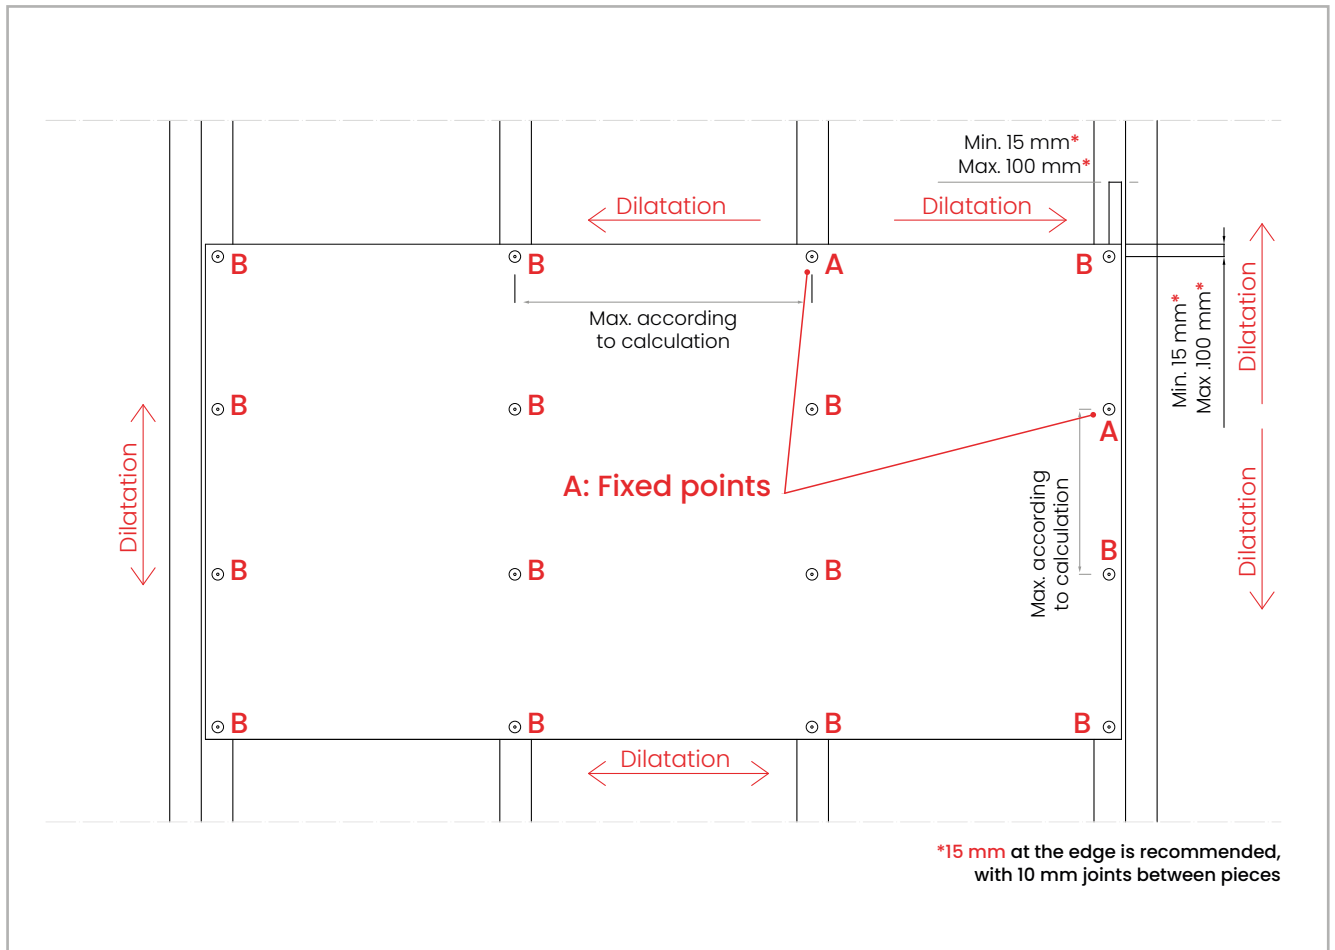

Drill hole in the substructure centred

INCORRECT INSTALLATION

Hole in the substructure not centred

* Tools to be used **centring tool** and **nozzle for riveting tool**. See pages 80 and 81.

Note: other rivets or similar fasteners may be used provided that their mechanical characteristics are equal to or superior to those specified by **STACBOND**.

FIXED POINTS **A**

SLIDING POINTS **B**

Rates in **mm**

* The size of the expansion joint between panels must be calculated according to the coefficient of thermal expansion according to the technical data sheet, and the dimensions of the pieces.

STB-T-PEG

GLUED SYSTEM

STB-T-PEG SYSTEM

DESCRIPTION

The **STB-T-PEG** is a kit system of unformed panels from **STACBOND composite panels for the assembly of ventilated façades**. It is a concealed fixing system that is quick to assemble and economical, and can be used for both horizontal and vertical cut-outs.

As a chemically bonded system, it is resistant to ageing and weathering. It also absorbs vibrations and offers multiple possibilities for façade design.

The substructure is composed of **L-spacers** (alloy 5005 H24 or INOX AISI 304/430), and **T or L profiles** (alloy 6063 T5/T6).

Spacers are provided in various lengths to accommodate the necessary thickness of thermal insulation and absorb all the irregularities of the façade. In order to avoid thermal bridges STAC has developed specific **INSULATING SOCKS** to be placed between L-spacers and wall facing.

STACBOND composite panel sheets are fixed to the substructure of vertical and/or horizontal T-profiles by means of a specific adhesive and double-sided tape.

STB-T-PEG SYSTEM

SYSTEM COMPONENTS

INSULATING WEDGE AND GROOVE WASHER (1)

REF. 05.19.068 / 05.19.072

REF. 05.19.070

Optional insulating wedges and insulation covers, for eliminating thermal bridges in spacers.

SPACER L (2)

REF. 05.19.041 / 05.19.044 / 05.19.051 / 05.19.052 / 05.19.053 / 05.19.054 / 05.19.055 / 05.19.056

Designed to connect the studs to the supporting wall. Available in different sizes depending on the desired system thickness.

SPACER DOUBLE L

REF. 05.19.042 / 05.19.045

Designed to jointly connect two studs to the supporting wall.

PROFILE T (3)

REF. 05.19.043

In vertical joints between cassettes, for fixing **STACBOND composite panels**.

PROFILE L INTERMEDIATE (4)

REF. 05.19.059

In the intermediate position of the cassettes, for fixing **STACBOND composite panel**.

ANCHOR AND SCREW

REF. STB-T0800 / STB-T0801

For fixing the spacer to concrete or masonry. The specific load shall be checked by extraction test according to ETAG 020.

STB-T-PEG SYSTEM

ADDITIONAL COMPONENTS

INTERMEDIATE L PROFILE

The profile L INTERMEDIATE is used in addition to the T-profile, thus reducing the weight of the substructure.

It is used as an upright for fixing intermediate points of **STACBOND composite panels**.

PANEL GLUING

1. Cleaning of the substructure and priming. The substructure must be clean, dry, homogeneous, free of oil, grease, dust and loose or poorly adhering particles. Paints, grouts and other coatings must be removed. The primer shall be applied with a product that reinforces the adhesion of the adhesive putty to the substructure, SIKATAACK PANEL PRIMER (or similar).

2. Application of double-sided adhesive tape. SIKATAACK PANEL -3 double-sided adhesive tape (or similar) is used for the initial fixing of the panels until the adhesive polymerises to achieve a minimum adhesive thickness of 3 mm, which absorbs possible expansion and vibrations produced in the STACBOND composite panel façade. Long-term resistance is achieved only with the adhesive.

3. Elastic adhesive. Apply a continuous vertical bead of SIKATAACK PANEL 50 (or similar) elastic adhesive using its triangular nozzle (8 mm wide, 10 mm long) at least 5 mm away from the tape. For correct application, the application gun must be positioned perpendicular to the surface.

4. Placement of the panel. Remove the protective film from the double-sided adhesive tape. Carefully position the panel in its precise place and press firmly until the panel comes into contact with the double-sided tape.

STB-CH evo®

System compatible with
horizontal stiffener and
bottom clip.

See installation instructions
on page 33

The **STB-CH** is a kit system based on hanging cassettes made of **composite STACBOND panels for the assembly of ventilated façades**. It is a versatile, fast-assembly, concealed fixing system, specially designed to develop façades with horizontal or vertical modulation.

The substructure is made of **OMEGA profiles** and **DOUBLE T spacers** made of 6063 T5/T6 aluminium alloy, on which the already formed cassettes are anchored.

These spacers have different lengths to accommodate the required thickness of thermal insulation and to absorb all the irregularities of the façade. For the

thermal bridge break **STAC** has developed specific **INSULATING WEDGES** to be placed between the **spacers DOUBLE T** and the wall facing.

The connection of the formed cassettes to the substructure is achieved by means of recesses in the vertical flanges of the cassettes and their hidden stiffeners attached on the rear face, so that they rest on the hanger supports and are screwed or riveted to the OMEGA profiles.

The **STB-CH** system complies with the main international certifications.

SHIMS AND COVER (1)

REF. 05.19.067 / 05.19.069 / 05.19.073

REF. 05.19.071

Optional insulating wedges and insulation covers, for eliminating thermal bridges in spacers.

SPACER U

REF. 05.19.046 / 05.19.047

For profile and system fixing to the bracket. Available in different sizes depending on the desired system thickness.

BRACKET SET STB-CH HANGING (4)

REF. 05.19.013

To hang CH tray panels to the substructure. Fixed to the Omega profile using 2 self-drilling screws.

SPACER DOUBLE T (2)

REF. 05.19.004 / 05.19.005 / 05.19.006 / 05.19.007 / 05.19.030 / 05.19.031 / 05.19.032 / 05.19.033 / 05.19.034 / 05.19.035 / 05.19.036 / 05.19.037 / 05.19.038 / 05.19.039

For profile and system fixing to the bracket. Available in different sizes depending on the desired system thickness.

OMEGA PROFILE (3)

REF. 05.19.003 / 05.19.040 / 05.19.048

In vertical joints and centerlines for CH tray panels fixing.

REINFORCEMENT PLATE FOR HANGER

REF. 19.019

Used in forming together with rivets all hanging hooks corresponding to 40 mm wide vertical flange tray panels.

STB-CH SYSTEM

SYSTEM COMPONENTS

CASSETTE FORMING PLATE

REF. 05.19.050

Used in forming together with rivets, standard 45 mm wide vertical flange tray panel corners.

ANCHOR AND SCREW

REF. STB-T0800 / STB-T0801

For fixing the spacer to concrete or masonry. The specific load shall be checked by extraction test according to ETAG 020.

SCREW FIXING TO UPRIGHT

REF. STB-T0600 / STB-T0610

For attaching the **CH cassette** to the OMEGA profile.

STIFFENER SCH

For cassette forming.

(*) Possibility of delivery lacquered

BRACKET SET STB-CH HANGING

The **STB-CH** hanger support set is the one used for the OMEGA profile.

The joint of the hanger piece is intended to prevent vibration noise caused by wind load, road traffic, etc.

This support is attached to the profile initially by means of tabs that allow vertical displacement to facilitate placement in its final position, and subsequently by means of self-drilling screws.

STB-CH SYSTEM

STANDARD CH WING CASSETTE 45 mm

STB-CH standard tray panel hooks are cut out during machining process so they can then be hung on previously installed hanging devices.

The cassette is formed by means of rivets and specific forming plates.

Once the cassette is in place, it is fixed to the upright by means of a self-drilling screw through the upper flange.

STB-CH SYSTEM

VERTICAL CASSETTE STIFFENER

VERTICAL STIFFENER

The vertical stiffener is a corner-shaped piece formed from machined **STACBOND** composite panel. It is used to reinforce CH cassettes, when they exceed certain dimensions. The stiffener is attached by double-sided tape and adhesive to the inside face of the cassette and riveted to the horizontal upper and lower flanges.

1. PREPARATION OF THE AREA

Dust and dirt shall be removed using mechanical processes, which shall consist of more or less deep sanding, depending on the existing dirt. Once cleaned, the area shall be primed with a specific product that reinforces the adhesion of the elastic adhesive SIKATAACK PANEL PRIMER (or similar).

2. DOUBLE-SIDED ADHESIVE TAPE

After priming, the self-adhesive tape CINTA SIKATAACK PANEL-3 (or similar) shall be applied. Subsequently, the elastic adhesive SIKATAACK PANEL 50 (or similar) shall be spread over cassette surface by applying a continuous bead adjacent to the double-sided tape.

3. FITTING AND FIXING OF THE STIFFENER

The stiffener shall then be placed in such a way that the entire surface of the stiffener is impregnated with adhesive. Finally the stiffener shall be drilled and riveted at the top and bottom against the horizontal flanges of the cassette.

STB-SZ

MALE-FEMALE SYSTEM

STB-SZ SYSTEM

DESCRIPTION

SEE ASSEMBLY
VIDEO

STB-SZ evo®

System compatible with
horizontal stiffener and
bottom clip.

See installation instructions
on page 58

The **STB-SZ** is a kit system based on **STACBOND composite panel cassettes for the assembly of ventilated façades**. It is a tongue and groove system with concealed fixing, versatile and quick to assemble, specially designed to develop façades with horizontal or vertical modulation, with predominantly blind parts and/or little surface area of openings or linear openings.

It consists of two 6063 T5/T6 aluminium alloy profiles 6063 T5/T6 on which the already formed cassettes are anchored:

- Lower female profile, so-called **S-profile**.
- Upper male profile, so-called **Z-profile**.

The substructure is made of **OMEGA profiles** and **spacers DOUBLE T** made of 6063 T5/T6 aluminium alloy.

These spacers have different lengths to accommodate the required thickness of thermal insulation and to absorb all the irregularities of the façade. For the thermal bridge break, **STAC** has developed specific **INSULATING WEDGES** to be placed between the spacers L and the wall facing.

STB-SZ SYSTEM

SZ CASSETTE FIXING

UPPER ANCHORAGE

VERTICAL SECTION

LOWER ANCHORAGE

VERTICAL SECTION

Note: **STACBOND** panels are supplied flat. The customer is responsible for cassette forming. No specific machines are needed.

STB-SZ SYSTEM

ADDITIONAL COMPONENTS

S-PROFILE AND Z-PROFILE

The STB-SZ system consists of two 6063 T5/T6 aluminium alloy profiles on which the pre-formed cassettes are anchored.

- Lower female profile, so-called **S-profile**.
- Upper male profile, so-called **Z-profile**.

– S-Profile

– Z-Profile

REINFORCEMENT STB-SZ

The STB-SZ reinforcement is a specific 200 mm long segmented profile covering the inner equidistance from the SZ formed cassette to the substructure.

The fastening of this component to the substructure profile is done by riveting or screwing.

The amount of STB-SZ reinforcements will be indicated in the wind calculation note issued by **STACBOND** technical office.

PIECE OF GASKET JOINT

The co-extruded gap seal is easily installed in the **Z-profile** with a maximum gap of 500 mm.

This avoids possible vibrations between cassettes, and facilitates the adjustment of cassettes to ensure the correct levelling of the pieces.

— Assembly of S and Z profiles.

STB-SZ SYSTEM

STANDARD SZ CASSETTE

The standard cassettes of the **STB-SZ** system have 30 mm flanges. They are mechanically fastened by means of rivets directly onto the longitudinal profiles S and Z for forming.

The **S-profile** is placed at the bottom and the **Z-profile** at the top of the cassette. The profiles provide high longitudinal rigidity to the cassettes.

STB-REM

RIVETED SYSTEM

SEE ASSEMBLY
VIDEO

The **STB-REM** is a kit system of unformed panels from **STACBOND composite panels for the assembly of ventilated façades**. It is an exposed fastening system that is quick to assemble and can be used for both horizontal and vertical cut-outs. It is a very versatile system that is adaptable and offers the possibility to execute curved areas in a simple way. Therefore, the **STB-REM** system meets all the requirements for the most demanding architectural coatings.

The substructure is made of **OMEGA profiles** and **spacers DOUBLE T** in aluminium alloy 6063 T5/T6 or INOX AISI 430.

The spacers are anchored to the wall by means of special mechanical fasteners, recommended in each case by fastener suppliers, and are supported by OMEGA profiles as vertical uprights.

This substructure of vertical and/or horizontal OMEGA profiles supports the **STACBOND** composite panel sheets which are riveted around the perimeter.

The **STB-REM** system complies with the main international certifications.

REF. STB-T0300 / STB-T0310 / STB-T0311 / STB-T0312

For fixing the upright to the spacer.

BLIND RIVET

REF. STB-R0100

For fixing **STACBOND** composite panels on STB-REM substructures.

(*) Possibility of delivery lacquered

STAINLESS STEEL BLIND RIVET

REF. STB-R0200

For fixing **STACBOND** panels on STB-REM substructures for high chloride exposure environments.

SAFETY SCREW

REF. STB-T0100

For fixing panels on structures STB-REM.

(*) Possibility of delivery lacquered

NOZZLE FOR RIVETING MACHINE

REF. STB-FIJA-201 / STB-FIJA-202

Allows to limit the clamping force of the rivet head against the panel.

DOUBLE DRILL BIT

REF. STB-FIJA-203

Allows simultaneous drilling of the panel to 7 mm diameter and the substructure to 5.1 mm diameter.

DEPTH STOP

REF. STB-FIJA-204

Together with the double bit it allows to limit the thickness of the 7 mm hole in the panel.

CENTERING DEVICE

REF. STB-FIJA-205 / STB-FIJA-206 / STB-FIJA-207

To drill a 5.1 mm hole in the substructure centred on the sliding points of the panel.

DRIVER BIT

REF. STB-FIJA-208

For fixing the safety screw.

MANUAL CENTRING DEVICE

REF. STB-FIJA-209

For centring the safety screw in the sliding points of the panel.

STB-REM SYSTEM

ADDITIONAL COMPONENTS

STB-REM UPRIGHT CONNECTION

Formed part in folded aluminium sheet of alloy 1050-H and thickness 3 mm, with perforations for joining upright and cross-member profiles with OMEGA cross-section.

This accessory allows the connection of the horizontal OMEGA profiles to the substructure and can reduce the use of anchors to the base wall.

It is fixed by means of a $\varnothing 4.8$ mm blind rivet or $\varnothing 4.8$ mm self-drilling screws. These connection solutions are compatible with the possible expansions of the substructure.

PANEL EXPANSION

The composite panel, being largely composed of aluminium, is **subject to expansion and contraction due to temperature changes**.

To place the panel in the exact desired position, the panel should initially be riveted at **1 or 2 fixed points**, with holes in the panel of **5.1 mm diameter**, the location of which should **minimise the expansion of the panel in all directions**.

To avoid possible problems due to this phenomenon, and to absorb possible expansion, the rest of the holes in the panel should be **sliding points**: i.e. if the rivet body diameter is 5 mm, the **hole in the panel should be 7 to 8.5 mm in diameter**.

It is also important that the 5.1 mm drill hole in the substructure and thus the positioning of the rivets is **perfectly centred on the sliding points**, in order to allow for equal expansion in all directions. We use **centring devices** for this purpose.

In addition, in order not to block the expansion of the panel, it is important to **limit the clamping force of the rivet head against the panel**. This is achieved by using riveting machine **nozzles** to **maintain a 0.2 mm gap** between the rivet head and the panel.

CORRECT INSTALLATION *

Drill hole in the substructure centred

INCORRECT INSTALLATION

Hole in the substructure not centred

* Tools to be used **centring tool** and **nozzle for riveting tool**. See pages 118 and 119.

Note: other rivets or similar fasteners may be used provided that their mechanical characteristics are equal to or superior to those specified by **STACBOND**.

FIXED POINTS **A**

SLIDING POINTS **B**

Heights in **mm**

* The size of the expansion joint between panels must be calculated according to the coefficient of thermal expansion according to the technical data sheet, and the dimensions of the pieces.

STB-PEG

GLUED SYSTEM

STB-PEG SYSTEM

DESCRIPTION

The **STB-PEG** is a kit system of unformed panels from **STACBOND composite panels for the assembly of ventilated façades**. It is a concealed fixing system that is quick to assemble and economical, and can be used for both horizontal and vertical cut-outs.

As a chemically bonded system, it is resistant to ageing and weathering. It also absorbs vibrations and offers multiple possibilities for façade design.

The substructure is made of 70 x 24.5 mm **TUBULAR PROFILES STB-PEG** and **ANGULAR SPACERS** made of 6063 T5/T6 aluminium alloy.

The spacers are anchored to the wall by means of special mechanical fasteners, recommended in each case by fastener suppliers, and receive the **TUBULAR PROFILES STB-PEG** as vertical uprights.

STACBOND composite panel sheets are fixed to the substructure of vertical and/or horizontal T-profiles by means of a specific adhesive and double-sided tape.

SPACER ANGULAR (1)

REF. 19.021

For connecting horizontal T-profiles to the vertical substructure.

TUBULAR PROFILE STB-PEG (2)

REF. 19.022

In vertical joints between cassettes, for fixing STACBOND composite panels.

STUDS JOINING STB-PEG (3)

REF. 05.19024

For attaching tubular profile STB-PEG and system to the support.

ANCHOR AND SCREW

REF. STB-T0800 / STB-T0801

For fixing the spacer to concrete or masonry. The specific load shall be checked by extraction test according to ETAG 020.

SEPARATOR / UPRIGHT FIXING SCREW

REF. STB-T0300 / STB-T0310 / STB-T0311 / STB-T0312

For fixing uprights to angle spacers and connecting tubular profiles STB-PEG to profiles.

STB-PEG SYSTEM

ADDITIONAL COMPONENTS

STUDS JOINING STB-PEG

The tubular profile STB-PEG connecting piece is made of injection-moulded Zamak 5 and enables the construction of bi-directional substructures by means of mechanical fastening between STB-PEG mullion profiles.

It is fixed by means of \varnothing 4.8 mm blind rivet or \varnothing 4.8 mm self-drilling screws. These connection solutions are compatible with the possible expansions of the substructure.

PANEL GLUING

1. Cleaning of the substructure and priming. The substructure must be clean, dry, homogeneous, free of oil, grease, dust and loose or poorly adhering particles. Paints, grouts and other coatings must be removed. The primer shall be applied with a product that reinforces the adhesion of the adhesive putty to the substructure, SIKATAACK PANEL PRIMER (or similar).

2. Application of double-sided adhesive tape. SIKATAACK PANEL -3 double-sided adhesive tape (or similar) is used for the initial fixing of the panels until the adhesive polymerises to achieve a minimum adhesive thickness of 3 mm, which absorbs possible expansion and vibrations produced in the STACBOND composite panel façade. Long-term resistance is achieved only with the adhesive.

3. Elastic adhesive. Apply a continuous vertical bead of SIKATAACK PANEL 50 (or similar) elastic adhesive using its triangular nozzle (8 mm wide, 10 mm long) at least 5 mm away from the tape. For correct application, the application gun must be positioned perpendicular to the surface.

4. Placement of the panel. Remove the protective film from the double-sided adhesive tape. Carefully position the panel in its precise place and press firmly until the panel comes into contact with the double-sided tape.

MANUAL DIE-CUTTING MACHINE

HANGING BOOT TOOLING DETAIL

V TOOLING DETAIL

STACBOND DIE-CUTTING MACHINE MANUAL

Easy-to-use and very versatile hand tool for use in the workshop as well as for mobile use in the assembly of facades, trade fairs, etc.

This machine is the ideal complement to work together with a manual milling machine or a wall saw.

Its interchangeable tools, specifically developed for the CH and SZ cassette formats of the **STACBOND** assembly systems, enable the hanging boots and corners to be die-cut for correct shaping.

REFERENCE	COMPONENT	OBSERVATIONS	MIN. UNITS
STB-MC-0010	STACBOND MANUAL DIE-CUTTING MACHINE WITH HANGING BOOT DIE-CUTTING TOOLING	Pre-assembled hanging boot tool allows adjustment for 40 and 45 mm flaps.	1
STB-MC-0011	STACBOND MANUAL DIE-CUTTING MACHINE WITH V DIE-CUTTING TOOLING	The pre-assembled V-shaped tooling is used to make the cassette forming corners.	1
STB-MC-0012	STACBOND MANUAL DIE-CUTTING MACHINE WITH HANGING BOOT DIE-CUTTING AND V DIE-CUTTING TOOLING	Available interchangeable tools (follow the instructions for use).	1
